

ABSTRACT OF THE DISCLOSURE

A memory card reader. The memory card reader includes a housing and a device. The device is disposed in the housing for accepting different types of memory cards. The device includes
5 a body, a first engaging plate, a second engaging plate, and a resilient plate. The body defines an accommodation for accepting different types of memory cards. The first engaging plate fastens to the body and has a release post. The second engaging plate selectively connects to the first engaging plate
10 in a first position or a second position. The second engaging plate defines a slot in which the release post is contained and moves therein. The resilient plate contacts and exerts pressure on the body so that the first engaging plate fastened to the body is pushed toward the second engaging plate and connects thereto.
